

# How I Do It Series NUMBER 1

## Day Case Laparoscopic Nephrectomy

IAN SMITH, ANURAG GOLASH & CLARE HAMMOND

(Original article published 2013, updated 2020)

<b>Patient Selection</b>	<ul style="list-style-type: none"> <li>• Non-functioning kidney or renal cell carcinoma</li> <li>• T1 tumour &lt;7 cm</li> <li>• Typical day surgery criteria, of which a well motivated patient is by far the most important</li> </ul>
<b>Anaesthetic Techniques</b>	<ul style="list-style-type: none"> <li>• We use a standardised protocol which is similar to that used for laparoscopic cholecystectomy</li> <li>• Induction with fentanyl and propofol. Tracheal intubation and controlled ventilation breathing sevoflurane in air-oxygen</li> <li>• Long acting intraoperative opioids are avoided</li> <li>• Multimodal antiemesis with dexamethasone and ondansetron</li> <li>• Intravenous hydration with 1 or (maximum) of 2 litres Hartmann's solution</li> </ul>
<b>Surgical Technique</b>	<ul style="list-style-type: none"> <li>• Standardised transperitoneal laparoscopic approach with patient in lateral recumbent position</li> <li>• Staples or locking clips to renal pedicle</li> <li>• Infiltration of trocar ports and extraction site with 30 ml of 0.5% levo-bupivacaine</li> <li>• No urinary catheter or routine drains</li> </ul>
<b>Peri-operative Analgesia</b>	<ul style="list-style-type: none"> <li>• Preoperative oral slow-release ibuprofen, 1600 mg</li> <li>• Intraoperative iv paracetamol near end of case</li> <li>• Fentanyl 2mcg/kg towards the end of the case</li> <li>• Postoperative regular paracetamol and codeine, if needed</li> <li>• Rescue intravenous fentanyl, if required</li> </ul>
<b>Take Home Medication</b>	<ul style="list-style-type: none"> <li>• Slow release ibuprofen, paracetamol and codeine for 5 days</li> <li>• Buccal antiemetics if PONV problematic while in hospital</li> </ul>
<b>Organisational Issues</b>	<ul style="list-style-type: none"> <li>• Surgeon must be experienced in laparoscopic perirenal procedures with a low rate of complications</li> <li>• District nurse follow-up after discharge (at least during early phase of learning curve)</li> <li>• Written information listing warning signs of serious postoperative complications and patients encouraged to self-refer to the surgical assessment unit if these signs are present</li> <li>• As with cholecystectomy, immediate postoperative outcome is difficult to predict, so increasingly a default to day case booking strategy is adopted</li> </ul>

### Authors' Addresses

IAN SMITH Consultant Anaesthetist (now retired)  
 ANURAG GOLASH Consultant Urologist  
 CLARE HAMMOND Day Surgery Unit Manager (now retired)  
 University Hospital of North Staffordshire, Stoke-on-Trent.

<b>Common Pitfalls</b>	<ul style="list-style-type: none"><li>• Wound drains are not a substitute for careful haemostasis</li><li>• We do not routinely measure urine output or renal function as small, asymptomatic changes do not alter management</li></ul>
<b>Anticipated Day Case Rates</b>	<ul style="list-style-type: none"><li>• 15–20% (for both benign and malignant)</li></ul>
